This invention describes a novel solid phase in which the surface shows invention also describes, a) a solid phase in which the surface shows reduced non-specific binding of ladd components; b) methods for reduced non-specific binding of ladd components; b) methods for reduced non-specific binding of ladd components; b) methods for preparing the solid support and c) methods of parallel analysis of many nucleic acid by optical methods, using the solid support. The solid phase is preferably part of a device that through a linker. The solid phase is preferably part of a device that allows fluid exchange and it is permeable to light in the wavelength cregions 200-400; 200-2000 or 400-800 nm. An external layer of solid cupport is removed, then the nucleic acid is coupled to it, optionally cupport is removed, then the nucleic acid is coupled to it, optionally cupport is removed, then the nucleic acid is coupled to it, optionally a feer attachment of a linker layer. Alternatively, after removing the extends of specifically phosphate, sulfate or carboxy.

Containing monomers or polymers) can be coupled to the surface, after coupling, optionally by a chemical reaction with hydrofluoric acid or containing monomers or polymers) can be completed to the surface is attachment or synthesis of nucleic acide. Only part of the surface is containing monomers or polymers) can removed particularly by a chemical reaction with hydrofluoric acid or analyzed represent a single population or many different populations and all subsequent steps are done in a liquid phase. The nucleic acid or on any population or an any serious sees is involved or linear polymer; (archidate promote or linear polymer; (archidate parallel analysis uses components labeled with ribo. A deoxyribonucleoside triphosphates, in which the label is cleavable. Particularly analysis involves cyclic sequencing and a preferred method contains the nucleoside triphosphate; for the solid support, with formation of a cetensible primer-matrix complex; performing acid to the s
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleotides or nucleic acids,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa
                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel solid support surface for parallel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   so assay sensitivity is improved. This sequence represents an oligonucleotide used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faget, more efficient and cheaper than prior at. Further claimed is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dA26-Cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                      Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dA36-Cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Optical fluorescent parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

                                                                                                                                                                                                                                                                                                                                                                                        ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                    This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. The present sequence is that of oligonucleotide da26-cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                     Optical fluorescent ultra-high parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                88; dna detection; DNA sequencing; DNA amplification; oligo dA26-Cy3.

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction, followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the sequence repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is sequence the interpretation of oligonalectide dA26-Cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                         Optical fluorescent ultra-high parallel process to analyse nucleic acid chains in which a sample solid is bound with a primer-matrix complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

This invention relates to a novel optical fluorescent process to analyse nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction. Marked nucleotides washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their signals removed. The signals removed. The solid phase is then washed and the signals repeated as necessary. The Nucleic acid chain sequence is then reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide dA26-Cy3 which was used in
                                                                             Ultra-high parallel analysis process to analyse nucleic acid chains in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ultra-high parallel analysis process to analyse nucleic acid chains in which a sample solid is bound and substrate material.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; dna detection; DNA sequencing; DNA amplification; oligo dA26-Cy3.

                                                                nucleic acid chains. Using the method, a sample solid is bound with a primer-matrix complex resulting in a cyclic reaction. Marked nucleotides are incorporated in the primer matrix by enzyme reaction. followed by washing of the solid phase. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The marked nucleotides are detected and their co-ordinates logged and the signals removed. The solid phase is then washed and the reconstructed using the signals. The process is faster, more efficient and cheaper than prior art. Further claimed is that the process able to determine many sequences in parallel. The present sequence is that of oligonucleotide da26-cy3 which was used in the development of the novel process of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparation of normalised, subdivided cDNA libraries from mRNA - by reverse transcription and amplification, used to screen for new genes and interacting proteins, potential drugs, and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to preparation of a normalised, subdivided library of amplified cDNA from the coding regions of mRNA in a sample. The method involves reverse transcription, with at least one cDNA primer of formula 5'-Conl-dTn2-Vn3-Nn4 to form first stand cDNA where Conl = any sequence of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4 are both 0, or n3 is 1 and n4 is at least 1; followed by second strand cDNA synthesis using the first strand as template and a second cDNA
                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Normalised, cDNA library, mRNA cloning, reverse transcription, immobilise, screening, hybridisation, nucleic acid amplification, expression pattern, drug development; PCR primer, RT-PCR; ss.

The linear multimer was produced by rolling circle synthesis in an example of the method of the invention for synthesising an RNA oligonucleotide, comprising combining a single-stranded circular coligonucleotide template comprising at least one copy of a nucleotide sequence complementary to the sequence of the desired RNA oligonucleotide with at least 2 types of ribonucleotide triphosphate and a polymerase enzyme to yield a single-stranded RNA oligonucleotide multimer complementary to the circular oligonucleotide template, where the RNA oligonucleotide multimer compressed multiple copies of the desired RNA oligonucleotide. The methods can be used for producing RNA oligonucleotides having a specific sequence and well defined ends. The structions produced can be used as probes, standards and diagnostic or therapeutic appears. They can be used for modifying the structure or function of a target molecule. They can also be used to
                                                                                                                                                                                                                                                                                                                                                                                         ö
primer of a similar formula, in the presence of DNA polymerase I (or its Klenow fragment) and amplification of double-stranded cDNA with a set of amplification primers. Comparison of cDNA in the prepared library with a database (a computer-generated list of molecular weights of restricted DNA fragments of known sequence) is used to determine presence of an expressed protein in a cell, also to detect changes in such expression (particularly for diagnosis of disease). Surfaces (chip) having amplified cDNA stably immobilised on it, obtained by a similar method, are used to screen for genes of a particular family, by hybridisation with nucleic acid from the family (to identify new genes) and to detect differences in expression patterns between cells. The polypeptides expressed by the libraries can be used for drug development. Sequences AAV71935 to

oligonucleotide, comprising combining a symmetraling unit interior.

Oligonucleotide, comprising combining a symmetral controlled to oligonucleotide template with at least two types of ribonucleotide complate with at least two types of ribonucleotide coligonucleotide template with at least two types of ribonucleotide multimer complementary to the circular oligonucleotide multimer complementary to the circular oligonucleotide multimer comprises multiple template, where the RNA oligonucleotide The method is useful for synthesising an RNA oligonucleotide with well-defined ends. The circular oligonucleotide is introduced into the cell using direct injection, calcium phosphate treatment, lipid-mediated delivery, or cation-mediated delivery. The method is useful for treating bacterial and/or viral infections in mammals, particularly drug resistant infections in mammals, particularly drug resistant infections, and for producing double stranded DNA oligomers. The method is performed in the absence of an oligonucleotide primer, or without the addition of auxiliary proteins. This sequence represents an oligonucleotide used in the method of the invention.
                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                  RNA oligonucleotide synthesis; ribonucleotide triphosphate; polymerase; electroporation; calcium phosphate treatment; lipid-mediated delivery; cation-mediated delivery; bacterial infection; viral infection; drug resistant infection; double stranded DNA oligomer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthesizing RNA oligonucleotide involves combining single-stranded circular oligonucleotide, ribonucleotide triphosphate and polymerase enzyme to yield desired RNA complementary to circular oligonucleotide
                                                                                                             Gaps

The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA semple containing at least one segment of (1); and cast emplate a DNA semple containing at least one segment of (1); and cast emplained of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or predisposition to a disease, associated with a gene that includes one or include PML; and prediagnosis (M3) of diseases associated with gene that includes one or more PML; and prediagnosis (M3) of diseases, especially markers, in a disease related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, especially prion diseases to be also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This
                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length.of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        region of the cow prion
                                                                                       Gaps

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and castermining the length of the resulting amplicon(8). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease. Associated with a gene that includes one or predisposition to a disease, associated with a predisposition to a disease. Associated with a predisposition to consider that a seasociated with a predisposition to diseases associated with a predisposition to diseases associated with a predisposition to diseases and for predisposis of such diseases, especially prion diseases to the also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, metabolic diseases also to type genes that encode milk proteins, particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion comprising a polymorphic microsatellite locus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining

The sequences given in AAQ83918, AAQ83952 and AAQ83940 are used in the construction of an oligonucleotide clamp. The clamp is a comb-type branched polymer which has 3' termini and was used to bind a target bequence comprising a segment of the HIV pol and nef genes in single stranded or double stranded forms. An oligonucleotide clamp is a compound complex after specifically binding to the target polynucleotide.

Complex after specifically binding to the target polynucleotide or a stable circular complex after specific binding to the target molecule and one or more pairs of binding molecies cone or more oligonucleotide moieties capable of specific binding to the target molecule and one or polynucleotide, the binding moieties of a pair are bought into inxapposition so that they form a stable covalent or non-covalent linkage or complex. The interaction of the binding moieties effectively clamps the specifically annealed oligonucleotide moieties to the target the specifically annealed oligonucleotide moieties to the target polynucleotide. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention relates to a method for synthesising a branched or multiply connected macromolecular structure, comprising oligonucleotide clamps (OC). The macromolecular structure is capable of specifically binding to a target molecule, and can therefore be used as probes. At least one OC comprises a target binding sequence that binds specifically and stably with the target molecule, and at least two OCs comprises signal generation moieties capable of generating a detectable signal in the presence of the target molecule. In addition the OCs are connected to one another by thioalkylamino, or thiophosphorylalkylamino bridges. The
                                                                                                                                                                                                                                                                           Synthesizing branched nucleic acids useful as diagnostic and molecular probes, involves combining first units having haloalkylamino groups and second units having thiol or phosphorothioate groups.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genotype; plant; rice; semi-dwarf; sd-1; polymorphism; detection;

셤 ઠે The present invention describes a method for judging the genotype of a region around a plant semi-dwarf (sd-1) gene in which polymorphisms are present, by detecting the polymorphisms. Also described: (1) examining semi-dwarf characteristics of a plant using the judgment method with detection of polymorphisms; (2) oligonucleotides for amplifying sd-1 DNA regions, which are primers for judging the genotype of a region around a plant sd-1 gene; (3) reagents for judging the genotype of a region around a plant sd-1 gene; (3) reagents for judging the genotype of a region around a plant sd-1 gene; (4) reagents for judging the genotype of a region around a plant sd-1 gene; (4) reagents for judging the genotype of a region around a plant sd-1 gene; which is applicable in genotyping by (3) CAPS ((derived) cleaved amplified polymorphic sequence) for examination of the semi-dwarf character of rice to identify desirable strains e.g. with high crop yield, peet realstance and resistence to flooded water. The method is easy and quick, in which a seedling is required for studying single nucleotide polymorphisms (SNPs) for genotyping, without needing cultivation of seedling to fully-grown plant for judging heterozygote and distinguishing morphology. The present sequence represents a rice sd-1 invention. Rice sd-1 is located on chromosome 1. ; 0 cDNA library; directionally cloned cDNA library; screening; Gaps .; 0 3; DB 1; Length 30; 3.6e+02; 2; Indels Normalised library first strand cDNA synthesis primer. Human tissues were obtained for construction of a variety of cDNA libraries, including infant brain, adult brain and adult hippocampus. Bach of the cDNA libraries had a characteristic sequence identifier, provided by the oligonucleotide utilised to prime first strand cDNA synthesis (see AAQ87894-Q87907 for these primer sequences; all these synthesis (see AAQ87894-Q87907 for these primer sequences; all these forfiners have the PacI restriction site for directional cloning of cDNAB). Each of the libraries was propagated in the form of single-stranded (ss) circles and normalised separately by a novel method. The method comprises: generating fragments complementary to the 3' non-coding sequence of the special duplexes; melting and reassociating them to appropriate Cot; and purifying the unassociated so circles to generate a normalised cDNA library. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                EST; expressed sequence tag; ss; polymorphic repeat; tandem repeat; polymorphic marker prediction of ubiquitous simple sequences; POMPOUS; Rep.Y; human; genetic disease; drug-treatment; Machado-Joseph; Haw River syndrome; Huntington's disease; fragile-X syndrome; Predreich's ataxis; myotonic dystrophy; hyperandrogenaemia; spinal atrophy; bulbar atrophy; spinocerebellar ataxia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                       repeat within a coding sequence (expressed sequence teg, EST), which repeat within a coding sequence (expressed sequence teg, EST), which the repeats for polymorphic probability and generating a dataset correlating the repeat with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTB

Polynucleotides encoding snake venom protease (SVP) were isolated from brown snake ADG83825, coastal taipan ADG83827, inland taipan ADG83829, red belly ADG83831, tiger ADG83833 and rough scale ADG83835 snake venom gland cDNA libraries. The invention is based on the discovery of the cofactor-independent prothrombin activating activity of these SVPs. The SVPs can be used e.g. to promote haemostasis
                                     invention discloses a method for identifying a candidate polymorphic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a polynucleotide derived from the 4q12-4q13 region of human chromosome 4 and encoding a zsig63 polypeptide, a secreted salivary protein with anti-microbial activity. Due to their microbial activity, the sequences can be used in the study of microbial infections, e.g. for recombinant production of anti-microbial proteins. The sequences can be used in the treatment of tooth decay, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections, skin infections, epithelial wounds, chronic tissue damage, acquired immunodeficiency syndrome (AIDS), cyptic fibrosis, lung infections, sarcoidosis, emphysema and chronic bronchitis. This sequence represents a sequencing primer for cDNA encoding human zsig63
and prevent blood loss such as during surgery or for treatment of wound resulting from injury or trauma, and may be useful as a topical fibrin 'glue' or 'sealant'.
                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Novel secreted salivary protein, zsig63 and polynucleotide encoding it useful for treating microbial infections, inflammatory conditions, dental caries and lung infections associated with cystic fibrosis.

Example 1; Page 29; 33pp; English.

The present invention relates to a new secreted salivary protein, zsig63.

The invention is useful for detecting in a test sample, the presence of
an antagonist or agonist of zsig63 protein activity. The invention is
also useful as an immunogen for producing an antibody to zsig63

CC polypeptide. zsig63-cytokine fusion proteins or antibody-cytokine fusion

protein are useful for enhancing in vivo killing of target tissues.

CC periodic composition comprising purified zsig63 polypeptide are

useful in the treatment of conditions associated with pathological

microbes, including bacterial, fungal and viral infections. High

expression of ssig63 in salivary gland suggests that anti-microbial

CC sapplications are useful for treatment of dental caries (tooth decay),

periodontal disease, thrush and gastrointestinal disease. Other

conjugations can be used in uninary tract infections, vaginal infections,

prevention of infection in skin and other epithelial wounds. The

polypeptides can be used in uninary tract infections, vaginal infections,

prevention of infection in skin and other epithelial wounds. The

polypeptides can be used in uninary tract infections, vaginal infections,

prevention of infection in skin and other epithelial wounds. The

polypeptides can be used in uninary tract infections for such pro
inflammatory activity include the treatment of chronic tissue damage,

when pro-inflammatory activity is desired. Applications for such pro
inflammatory activity include the treatment of chronic tissue damage,

collypeptides may be useful as anti-inflammatory agents. The invention is

such as AIDS (acquired immunodeficiency syndroment immune system,

such as AIDS (acquired immunodeficiency syndroment immune system,

such as AIDS (acquired immunodeficiency syndroment in intervention is

that have undergone chemocherapy, radiation treatment. The invention is

also useful for the treatment of lung infections associated with cystic

Novel secreted salivary polypeptide, zsig63, useful as antimicrobial agent for treating microbial infection, dental carries, periodontal disease, thrush gastrointestinal disease, and for aiding digestion.

Example 1; Page 29; 33pp; English.

The invention relates to human secreted salivary polypeptide designated as zaig63 and nucleic acid molecules encoding such polypeptides. zaig63 can be used in detecting agonists and antagonists of its activity, and is also useful as a host defense polypeptide, immune modulating factor, antipathogenic polypeptide, cell-cell signalling molecule, growth factor, cytokine, or as secreted extracellular matrix associated protesins with growth factor hormone activity. It is useful for treating conditions associated with pathological microbes, including bacterial, fungal and cyral infections, for treating dental carries (tooth decay), periodontal clisease, thrush and gastrointestinal disease, for treating urinary tract infection, vaginal infection and for preventing infection in skin and controllors and protect against pathogenic colonisation and invasion, for treating chronic tissue damage erg. damage in extremities associated with thabetes and useful as anti-inflammatory agents. It is useful as marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an isolated zsig63 polypeptide comprising at least 90% identity to an amino acid sequence which comprises domain 1 of zsig63, domain 2, domain 3, maturez sig63 and full length zsig3. Also included are the polymucleotide encoding zsig63, a zsig63 expression vector, a cultured cell comprising the vector and expressing the protein,
of lung dysfunction, salivary gland dysfunction, or dysfunction of prostate gland. It is also therapeutically useful for aiding digestion. Polynucleotides of the invention are used in gene therapy for increasing or inhibiting zsig63 activity, for detecting abnormalities on human chromosome 4 associated with disease or other human traits and as diagnostics in forensic DNA profiling. Sequences of the invention are useful for stimulating proliferation or differentiation of cardiac myocytes, for proliferation or differentiation of addiacting chandrosarcomas, atherosclerosis, restenosis and obesity. The present sequence is a primer used in the identification of human zsig63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel isolated zsig63 polypeptide, member of the adhesin family, useful for treating dental carries, periodontal disease, thrush, gastrointestinal disease, urinary tract infections, vaginal infections,
                                                                                                                                                                                                                                                                                                                                     Gaps

a DNA encoding a fusion protein (comprising amino acids 1-15, 16-37, 38-16, 127-219 or 16-219 of zsig63 and an additional protein), using a zsig63 reporter gene construct to identify zsig63 reporter gene construct to identify zsig63 and producing an anti-zsig63 antibody using zsig63 immunogenic peptides, Zsig63 is useful for detecting in a test sample, the presence of antagonist of useful for detecting in a test sample, the presence of antagonist of catig63 protein activity. Zsig63 has antimicrobial activity and since exhibits high expression in salivary thrush, and gastrointestinal disease, urinary tract infections, vasin infections and other epithelial wounds. The polypeptides can be used for treating disease, urinary tract infections, vasin infections and other epithelial wounds. The polypeptides can be used to establish normal microflora and protect against pathogenic colonization and civity for treating chronic, tissue damage particularly in areas having limited or tamaged vascular system, e.g. in diabetes, and for treating limited or democherapy, radiation treatment, for treating ung infections e.g. in chemotherapy, radiation freatment, for treating ung infections e.g. in cystic fibrosis. Detection of zsig63 polypeptide at relatively high cystic fibrosis. Detection of zsig63 polypeptide at relatively high marker of lung dysfunction in Saig63 polypeptide at relatively high conditions associated with salivary gland or lung dysfunction and soconditions and and may be used to replace serum that is commonly used in culture media and may be used to replace serum that is commonly used in culture media and may be used to replace serum that is commonly used in charged and may be used to replace serum that is commonly used continue and and may be used to replace with the tasing imperfects, and dencin dysplasia type II). Zsig63 is an adheshin family member. The continue appears the engage of isolate and sequence is a primer used to isolate and sequence nucleic acdis encoding human zsig63
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Producing a population of double-stranded product DNA molecules, useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             acid manipulation, mRNA profiling, polymerase chain reaction,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a DNA molecule containing a sequence complementary to a Bovine Viral Diarrhea Virus (BVDV) RNA. The RNA when introduced into susceptible host cells, induces the generation of infectious BVDV particles. The attenuated BVDV clone or strain is useful in the manufacture of a vaccine for the prophylaxis and treatment of BVDV infections. The invention is useful in gene therapy. The present sequence is a PCR primer used to amplify BVDV gene. (Updated on 27-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for the prophylaxis infections, comprises
profiling, comprises amplification by nested polymerase chain
                                                                   product DNA molecules comprising amplification by a nested PCR method. The method is useful in profiling mRNA transcribed in a system under investigation. The oligonuclectides are used as size standards in electrophoresis, and as intercond controls allowing for calculation of relative amounts of material present. The present sequence represents specific example of a PCR primer used in the method of the invention

Zsig63 is a member of the adhesin family. The invention is useful for diagnosing and treating microbial infections such as dental carries, periodontal disease, thrush, gastrointestinal disease, uninary tract infection, vaginal infection, skin infection or epithelial wounds and lung disfunctions such as AIDS, lung infections and cancer. The invention is also useful in gene therapy. The present sequence is human Zsig63 cDNA cloning and sequencing primer. This sequence to obtain the full-length Zsig63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   wer polynucleotide (I) encoding a zaig63 polypeptide, useful for diagnosing and treating microbial infections, e.g. dental carries, thrush, gastrointestinal disease, skin infection, or epithelial wounds, AIDS, lung infections, or cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

combryo having integrated within its genome, a heterologous nucleotide embryo having integrated within its genome, a heterologous nucleotide embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, coding for a product of the invention is useful as a model or the study of disease with the aim of improving treatment, to relieve for the study of disease with the aim of improving treatment, to relieve commentic or a pharmaceutical formulation, and for the development of a disgnostic method. It can also be used as a model for a skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal atopic dermatitis, eczema, accessisting of epidermal hyperkeratosis. The mammal of the invention is also useful as a compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents a 5' RACE cDNA synthesis primer used in a method of detecting homologues to human caracturing and the homotryptic enzyme, SCCE, gene. SCCE is a serine stratum corneum chymotryptic enzyme, SCCE, gene. SCCE is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the transgenic mammals described in the invention

The invention relates to specific expressive sequential labels of tubulin of tea tree and their biochips. The invention can be used in evaluation of crop seed sources, early prediction of hybrid vigor, research on plant resistance, determination of plant SNP, inspection of transgenic crop security, and soreen of herbicides and agro-chemicals, etc. The present sequence represents a tea tree tubulin oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                              Tubulin differential expression sequence label of tea tree and biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotide biotin-T25 for novel nucleic acid immobilisation method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Immobilisation; solid support; salt; cationic detergent; capture probe;

                                                                                                                                                                                                                            Oligonucleotides AAQ95959-82 are examples of oligonucleotides used in a novel method of immobilising oligonucleotides to a solid support by incubating in the presence of a salt or cationic detergent e.g. NaCl (50-250 mM, pH 6.0-8.0) or 1-ethyl-3-(3'-dimethyl amino propyl)-1,3 carbodiimide hydrochloride (ECD). The oligonucleotides can be capture probes for detection of specific nucleic acids by hybridisation or can be primers for template-dependent extension from the immobilised primers on nucleic acid from a target organism. The method can be used in hybridisation assays, sequencing and analysis of genetic polymorphism
                                                                                                                                                                         Immobilising synthetic nucleic acid on solid support - by incubation in presence of salt or cationic detergent, for use in hybridisation assays, sequencing and analysis of polymorphism.

The present invention describes a rapid pairing reagent (I) for the isolation or detection of a polymucleotide (PN) analyte molecule having a selected target base sequence, in a sample containing the analyte molecule and non-target polymucleotide, comprising a capture component (A) and a target-specific probe (B) linked to a solid substrate. The isolated sequences are useful for enzymatic amplification. (I) is capable of rapidly binding nucleic acids in the sample and placing them in close proximity to target probes on the reagent, thus enabling binding under low stringency. Combination of rapid capture and concentration of polymucleotides with selective targeting of analyte molecules, greatly enhances the isolation process. Non-ionic morpholino oligomers used as probes are not extended by polymerases and therefore do not interfere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Reagent for rapidly detecting or isolating target nucleic acid sequences in polynucleotide-containing sample, comprises capture component and target-specific probe linked to solid substrate.
                                                                                                                                                                                                                                                              This sequence represents a PCR primer used to isolate DNA encoding the human Nck associated protein 1 (Napl) of the invention. Napl inhibits apoptosis. The protein can be used in the investigation, diagnosis and treatment (e.g. by gene therapy) of Alzheimer's disease
                                                                      Protein inhibiting apoptosis, useful in the diagnosis and treatment of Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Rapid detection; probe; target nucleic acid; enzymatic amplification;

The present sequence represents a capture probe specific for a c-myc fusion target. It is used in the method of the invention. The specification describes the use of non-nucleoside spacers to immobilise an array of capture probes on a solid support. The solid support carries an array of capture probes, each consisting of non-nucleoside spacers on a notigonucleotide to which a nucleic acid-protein fusion or a ribons an oligonucleotide to which a nucleic acid-protein fusion or a ribons with the support surface, ensuring efficient hybridisation between capture probes and bound nucleic acid/protein this minimaling denaturation of the protein which may then companies, while minimaling denaturation of the protein which may then compared in interactions between proteins and compounds (e.g. other proteins, ligands or nucleic acids), particularly to identify potential therapeutic agents, ensyme substrates or unknown proteins that interact with drugs, but also for diagnosis (detecting disease-associated proteins) and for quantifying target molecules in a sample
                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Attaching capture probes to solid phases through non-nucleic spacers, producing arrays for detecting interactions of proteins with other compounds, e.g. for drug screening.
with amplification of target molecule. AAA39316 to AAA39316 represent oligonucleotides used in the exemplification of the present invention

The invention relates to a method of preparing a controlled pore glass-polytetrafluoroethylene (PTE) resin chromatography membrane, comprising combining controlled pore glass and an aqueous dispersion of PTFE to form a paste-like mass, heating the paste-like mass at 50-70 plus oC, calendering to form a foldable sheet, and sintering the sheet to produce a rigid, porous sheet. The method prepares a controlled pore glass-PTFE resin chromatography membrane for use in various biotechnical procedures. The membrane is useful in place of controlled pore glass as a support for the synthesis, isolation, and purification of nucleic acids and for the isolation and purification of proteins. The method produces a membrane that may be used in lieu of controlled pore glass. The present sequence trapresents an oligonucleotide prepared on the membrane in an example which demonstrates the method of the invention
                                                                                                                                                                                                     Glass-synthetic resin membrane; pore glass-polytetrafluoroethylene resin;
chromatography membrane; PTFE; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Preparation of controlled pore glass-polytetrafluoroethylene resin chromatography membrane by heating, calendering and sintering mixture of controlled pore glass and aqueous dispersion of polytetrafluoroethylene.
                                                                                                                                                                        Example oligonucleotide #2 prepared on glass-synthetic resin membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a method and device for the manufacture of a probe array. The method involves using an inkjet system to discharge a probe solution through a solution discharging head, so as to form a number of probes on a solid matrix. Mists of the probe solution generated during probe solution discharge are caught by an electrostatic adeorption mechanism. The method and device are suitable for manufacturing probe arrays for analysing DNA sequences, and for the simultaneous detection of multiple genes. The method and device of the invention prevent the scattering of probe positions and the mixing of different probe solutions. The present sequence is related to the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Probe array; microarray; DNA array; DNA chip; manufacture; inkjet system; electrostatic adsorption mechanism; DNA analysis; simultaneous gene detection; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Manufacturing of probe carrier for carrying probes for base sequence analysis of genetic deoxyribonucleic acid and simultaneous multiple item diagnosis of gene by ink jet process while removing mist of probe
solution, and removes liquid droplets adhering to discharge nozzle. The present sequence is used in the exemplification of the invention.
                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                              Probe carrier manufacturing method for inkjet system, involves scanning liquid discharge head in direction orthogonal to scanning direction, at angle satisfying predetermined relation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel probe carrier and the method for manufacturing the carrier. The invention enables stable discharge of solution, and removes liquid droplets adhering to discharge nozzle. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Probe carrier manufacturing method for inkjet system, involves scanning liquid discharge head in direction orthogonal to scanning direction, at angle satisfying predetermined relation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a novel probe carrier and the method for manufacturing the carrier. The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and determining the length of the resulting amplicon(s). Also described are:

The method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and prediagnosis (M3) of diseases associated with gene that include PML. The method is used to identify microsatellite markers, in a disease related gene, that are associated with a predisposition to disease and for prediagnosis of such diseases, especially prion diseases but also cype genes that encode milk proteins, classases and for prediagnosis of such diseases, aspecially prion diseases because or transcription factors. The method is simpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a prion protein polymorphic microsatellite marker
                                                                                                                                                                                                                                                                                                      Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         fluorophore; detection; antibody; antigen; avidin; hormone; ss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Fluorophore-labeled biological detection oligonucleotide #2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.9%; Score 25; DB 1; Length 25;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method and device for the manufacture of a probe array. The method involves using an inkjet system to discharge a probe solution through a solution discharging head, so as to form a number of probes on a solid matrix. Mists of the probe solution generated during probe solution discharge are caught by an electrostatic adsorption mechanism. The method and device are suitable for manufacturing probe arrays for analysing DNA sequences, and for the simultaneous detection of multiple genes. The method and device of the invention probe scattering of probe positions and the mixing of different probe solutions. The present sequence is related to the invention.

The invention relates to an oligonucleotide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of fluorophores is not located at either the 3' or 5' terminus of ON. ON is useful for sequencing nucleic molecules. ON is useful for detecting biological molecules e.g., antibody, antigen, avidin, protein, peptide, bacteria, virus, blood cell or hormone. ON is capable of providing strong fluorescence signals at different wavelengths. This sequence corresponds to an example of an oligonucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an oligonucleotide molecule (ON) labeled with several fluorophores of one or more types embedded in its backbone, where one or more of the fluorophores is not located at either the 3' or 5' terminus of ON. The method involves forming labeled indexes on the substrate at specific positions, and applying probecontaining solutions to these specific positions. Preferably, the method further comprises forming a dividing wall (especially by photolithography methods) for partitioning the specific positions on the substrate, irradiating the substrate with plasma in a gas atmosphere containing fluorine, and removing ingredients of the gas adhering to the specific positions. The invention also relates to a method of identifying the position of a target substrance bonded to the process of and a substrate by utilizing the indexes. The probe array is used for analyzing gene sequences or for conducting multiple genetic diagnoses. The inventive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /mod_base= OTHER

The method involves forming labeled indexes on the substrate at specific positions, and applying probecontaining solutions to these specific positions. Preferably, the method
method can provide an array substrate that prevents probe solutions being applied at adjacent sites from being mixed with each other and allows the probe solutions to sufficiently spread in the respective regions to prevent blank areas from being produced, thereby permitting the efficient production of reliable probe arrays. Sequences AEB26389-AEB26393 represent oligonicalcotides used to illustrate the invention. The present sequence represents a probe which is complementary to the target shown as SEQ ID NO:3 (AEB26391) which was immobilized on a substrate according to

cc further comprises forming a dividing wall (especially by photolithography cc methods) for partitioning the specific positions on the substrate, irradiating the substrate with plasma in a gas atmosphere containing fluorine, and removing ingredients of the gas adhering to the specific positions. The invention also relates to a method of identifying the contining the invention also relates to a method of identifying the contining the position of a target substance bonded to the probe on such a substrate by cutilizing the indexes. The probe array is used for analyzing gene capplied at adjacent sites from being multiple genetic diagnoses. The inventive completed at adjacent sites from being mixed with each other and allows the probe solutions to sufficiently spread in the respective regions to probe colutions to sufficiently spread in the respective regions to production of reliable probe arrays. Sequences AEB26393 AEB26393 Crepresent oligonucleotides used to illustrate the invention. The present sequence represents a tetramethylrhodamine-labeled model target sequence which is complementary to the probe shown as SEQ ID NO:4 (AEB26392).

This sequence represents a molecular scaffold which may be used in a composition of matter comprising multiple fluorophores. The fluorophores are bound to the molecular scaffold at separate predetermined positions, to permit fluorescence energy transfer between two fluorophores. The fluorophores are characterized by maximum emission wavelength of one being greater than the minimum excitation wavelength of the other. The composition is useful for determining whether a preselected nucleotide residue is present at a predetermining whether a preselected nucleotide residue is present at a predetermined position within a nucleic acid. It is also useful in multicomponent analysis including multiplex biological analysis, and identifying multiple single nucleotide polymorphisms. The presence of a number of given nucleotide residues is determined simultaneously by the composition of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition of matter useful for multi-component analyses, comprises multiple fluorophores bound to molecular scaffold at preset positions to permit fluorescence energy transfer between two fluorophores.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes novel contiguous and partially overlapping cDNA sequences and their encoded polypeptides, designated PA153, transcribed from human pancreatic tissue and which have cytostatic activity. The PA153 polymucleotides, proteins and antibodies are all useful in methods of detection. Detection of PA153 polymucleotide, antigens or anti-PA153 antibodies in a sample is indicative of pancreatic disease. PA153 antibodies (antagonists) can also be used in vivo for therapeutic use, e.g. treatment of pancreatic disease, tumours or metastases. Antisense PA153 polymucleotides can be used in gene therapy of pancreatic diseases. AAX78712-X78725 represent primers used in the method of the invention

                                                                                                                                                                                                                                                                  The present invention relates to the isolation of a novel cytokine, zalphall Ligand and the polynucleotide encoding it. The invention also gives the sequence for the zalphall receptor and the polynucleotide encoding it. The zalphall Ligand polypeptide stimulates proliferation of attural killer (KK) cells or NK cell progenitors, the activation of natural killer (KK) cells or NK cell progenitors, the activation of NK cells proliferation of F-cells proliferation of B-cells stimulated with anti-IgM antibodies. The zalphall Ligand polypeptide is also useful in preparing antibodies that bind to zalphall Ligand epitopes. The zalphall Ligand polypucleotides can be used as probes or primers to clone regions of a zalphall Ligand gene, and in gene therapy. Zalphall Ligand may also be used to identify inhibitors of its activity, to enhance the generation of anti-tumour responses with or without the influsion of donor lymphocytes, and to activate or stimulate the immune system. The present sequence represents a sequencing primer used to sequence cDNA clones in the isolation of human zalphall Ligand

The LS147 polypeptide is useful for preparing a composition for treating cancer, e.g. lung cancer using gene therapy. This sequence represents a universal primer used to sequence LS147 expressed sequence tag (EST)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a purified polypeptide or its fragment derived from the LS147 gene capable of selectively hybridising to the nucleic acid of the gene and has at least 50% identity with the polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; 88; Zalphall ligand; Zalphall receptor; immune response; tumour progression; metastasis; tumour stasis; haematopoietic tumour; lymphoma; B cell tumour; systemic lupus erythematosus; rheumatoid arthritis; myaethenia gravis; diabetes; infectious disease; immunocompromised patient; HIV infection; vaccine; primer.

```

```
The invention relates to a novel isolated zalphall ligand polypeptide. The polypeptide of the invention may be useful for boosting immunity to infectious diseases and treating immunocompromised patients, such as HIV patients, as well as in improving vaccines. The current sequence is that of the PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New zalphall ligand polynucleotide and polypeptide molecules, useful for treating cancer, e.g. melanoma, solid tumor, hematopoietic tumor, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; zalphall ligand; pharmaceutical; cancer; immune response; melanoma; tumour; solid tumour; haematopoietic tumour; lymphoma; human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                              The invention relates to stimulating an immune response in a mammal exposed to an antigen or pathogen comprises administering a composition comprising mature zalphall ligand polypeptide comprising residues 32-162 of ADH44572 in a pharmaceutical vehicle. Also included are stimulating an immune response in a mammal exposed to an antigen or pathogen comprising: (a) determining (in)directly the level of antigen or comprising zalphall ligand polypeptide in a pharmaceutical vehicle; (c) determining (in)directly the level of antigen or pathogen in the mammal; (d) comparing the antigen or pathogen level in (a) with (b), where a change in the level indicates stimulation of immune response; or pathogen comprising; (a) determining a level of antigen or pathogen. Comprising: (a) determining a level of antigen or pathogen. Comprising: (a) determining a level of antigen or pathogen. Comprising: (a) determining a level of antigen. Or pathogen. Comprising: (a) determining a level of antigen. Or pathogen. Specific antibody; (b) administering a composition comprising zalphall igand polypeptide in a pharmaceutical vehicle; (c) determining a post comparing the level of the antigen. Or pathogen-specific antibody; and (d) comparing the level of the antibody in (a) with (b), where an increase in the antibody level indicates stimulation of immune response). The method is useful for stimulating an immune response in a mammal exposed to an antigen or pathogen, and for enhancing anti-tumour activity or resulting in a reduction in tumour progression, decrease in metastasis, or tumour stasis. The tumour may be a haematopoietic tumour, a lymphoma or antigen or pathogen and is useful for treating a wide or as B cell tumour may be a haematopoietic tumour, a lymphoma or pathogen in the minimal or perhoden in the minimal or minimal 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       range of diseases arising from defects in the immune system, e.g. systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, or diabetes, for boosting immunity to infectious diseases, treating
                                         Stimulating an immune response in a mammal exposed to an antigen or pathogen, useful for enhancing anti-tumor activity resulting in reduced tumor progression or metastasis, comprises administering zalphall ligand polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            zalphall ligand; immunity; infectious disease; immunocompromised patient; HIV; vaccine; human; ss; PCR; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequencing primer SEQ 39 used to analyse human zalpha11 ligand clone DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    immunocompromised parients, such as HIV+ patients and in improving vaccines. The present sequence is a sequencing primer used in the

acids (SEQ ID NO:2, human zalphall ligand), fully defined in the specification. Also described are: a pharmaceutical composition composition. Also described are: a pharmaceutical composition comprising the polypeptide, and a vehicle; a method of treating cancer in a mammal; a method of stimulating an immune response in a mammal with melanoma; an stolated polymucleotide comprising a sequence of nucleotides a tumour; an isolated polymucleotide comprising a sequence of nucleotides concodes a polypeptide that binds a receptor comprising 538 amino acids, cancer a polypeptide that binds a receptor comprising 538 amino acids, fully defined in the specification; a pharmaceutical composition comprising the polymucleotide encoding, in a pharmaceutically acceptable vehicle; an expression vector comprising the following operably linked comprising and an isolated polymucleotide molecule comprising at least 10 nucleotides of the polymucleotide sequence of 642 bp, fully clean in the specification. The molecules, compositions and methods are useful for treating cancer, e.g. melanoma, solid tumour, haemacopoietic tumour, or lymphoma. This sequence represents a primer used in the composition of human cytokine zalphall ligand.
                                                                                                                                                                                                                                                                                                                                                      ö

                                             The invention comprises a fusion protein that contains a zalphall ligand and a cytokine polypeptide (e.g. IL-2, IL-4, IL-15 or GM-CSF), the fusion protein of the invention binds to the human receptor protein. The protein of the invention is useful for stimulating the proliferation and/or development of hematopoietic cells. The protein of the invention is also useful in autologous marrow culture. The present DNA sequence represents a PCR primer that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to novel purified polynucleotides (I; ADW14170-ADW14176) and proteins (ADW14184-ADW14187) derived from lung tissue gene LS147. The sequences are useful for detecting, diagnossing, staging, monitoring, prognosticating, in vivo imaging, preventing or treating diseases of the lung, e.g. lung cancer, pneumonia (of all origins including viral, bacterial, and fungal), asthma, black lung disease, or adult respiratory distress syndrome. Recombinant constructs comprising (I) can be produced using, e.g. plasmid pINCY, which contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynuclectide encoding LS147 polypeptide, useful for detecting, diagnosing, staging, preventing or treating lung diseases, e.g. lung cancer, pneumonia, asthma, or adult respiratory distress syndrome.
                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Klass MR;

The leader sequence contains a poly(A) sequence from 5A to 35A, an additional sequence linked to the complete or deleted construct of poly(A) sequence, or at least one nucleotide substitution either in the complete or deleted poly(A) sequence. The leader sequence is inserted in a 5'-untranslated region (5'-UTR) adjacent to the site of initiation of translation. Leader sequences of the invention are useful for synthesizing polypeptides in a cell-free system.
universal priming sites adjacent to the 3' and 5' ligation junctions of the inserts. The present sequence is a universal primer used to sequence the LS147 inserts cloned in pINCY.
                                                                                                                                                                                                                                                                                                                                                                                                                            eader sequence; mRNA translation; cell-free system; protein production;

The invention relates to preparation of a normalised, subdivided library of amplified cDNA from the coding regions of mRNA in a sample. The method involves reverse transcription, with at least one cDNA primer of formula convolves reverse transcription, with at least one cDNA primer of formula convolves reverse transcription, with at least one cDNA where Conl = any sequence of 1-100 nucleotides; dT = deoxythymidinyl; n2 is at least 1; n3 and n4 convolves are both 0, or n3 is 1 and n4 is at least 1; followed by second strand convolves to a similar formula, in the presence of DNA polymerase I (or its primer of a similar formula, in the presence of DNA polymerase I (or its camplification primers. Comparison of CDNA in the prepared library with a cappasse (a computer-generated list of molecular weights of restricted at abase (a computer-generated list of molecular weights of restricted convolves to known sequence) is used to detect changes in such expression (particularly for diagnosis of disease). Surfaces (chip) having amplified convolves tably immobilised on it, obtained by a similar method, are used to sorder from the family (to identify new genes) and to detect differences in the expression petterns between cells. The polypeptides expressed by the convolves in the convolves the convolves the family (to identify new genes) and to detect differences in the convolves the family (to identify new genes) and to detect differences in the convolves the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preparation of normalised, subdivided cDNA libraries from mRNA - by reverse transcription and amplification, used to screen for new genes and interacting proteins, potential drugs, and for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         libraries can be used for drug development. Sequences AAV71935 to
AAV71946 represent primers used to exemplify the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an androgen receptor complex-associated protein (ARCAP) sequence and the CDNA encoding it. The protein is useful for socreening a compound that decreases AR-mediated (androgen receptor mediated) transactivation which involves contacting the ARCAP protein with a protein complex comprising an AR in the presence of a candidate compound, measuring the extent of binding between the polypeptide, and determining if the extent of binding is less than the extent of binding between the polypeptide and the protein complex in the absence of the candidate compound. The ARCAP DNA is useful for determining if a sample contains cancerous cells which involves providing a sample from a human patient and detecting ARCAP expression in the sample. The sequences are useful for determining whether a sample contains liver tumour cells. This sequence represents a 5'RACE PCR primer used to amplify human ARCAP DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; androgen receptor complex-coupled protein; ARCAP; PCR; primer; ss.
                                                                                                                                                                                                                     Human androgen receptor complex-associated protein 5'RACE PCR primer #1.
                                                                                                                                                                                                                                                                             Human; androgen receptor complex-associated protein; ARCAP; primer; ss; androgen receptor; AR; cancer; liver tumour; cytostatic; PCR; 5'RACE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel substantially pure androgen receptor (AR) complex-associated protein which binds to AR and increases ability of AR to transactivate androgen-responsive gene, useful as drug target for treating liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The present invention relates to the isolation of human androgen receptor complex-coupled protein (ARCAP), and the polynuclectide sequence encoding it. The ARCAP polypeptide complexes with an androgen receptor to increase the activity of the androgen receptor, transactivating the androgen responsing gene. The invention also describes a a vector containing the ARCAP polynuclectide sequence, and a host call containing the ARCAP polynuclectide sequence. The ARCAP polypeptide can be used as a treating agent. The present sequence represents a PCR primer used in the example of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               multivalent compound; binding group; cytostatic; antirheumatic; antiarthritic; antipsoriatic; antidiabetic; ophthalmological; antiarteriosclerotic; antiulcer; vasotropic; receptor tyrosine kinase inhibitor; angiogenesis; hyperproliferation; tumour; rheumatoid arthritis; psoriasis; diabetic retinopathy; atherosclerosis; ulcer; restenosis; contraceptive; ulcer; restenosis; contraceptive; ulcerine neovascularisation; KDR; kinase domain region; ss; PCR; primer;
                                                                                                                                                                                                                                                                                                                                                                                                 Novel substantially pure androgen receptor (AR) complex-associated protein which binds to AR and increases ability of AR to transactivate androgen-responsive gene, useful as drug target for treating liver
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gape

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                           The invention relates to a novel multivalent compound comprising two binding groups specific for different binding sites on the same target. The compound of the invention demonstrates cytostatic, antitheumatic, antiatrchritic, antiporatic, antidiabetic, ophthalmological, antiatrchritic, antiulcer and vasotropic activities and may act as an inhibitor of receptor tyrosine kinase activity. The compound may be used to prepare diagnostic imaging agents and pharmaceutical compositions for treating diseases associated with angiogenesis or hyperproliferation, particularly tunmours, but also theumatoid arthritis, psoriasis, diabetic retinopathy, atherosclerosis, ulcers and restenosis. Furthermore, the compound may be utilised as a contraceptive via inhibition of uterine neovascullarisation. The current sequence is that of the RT-PCR primer region)-related RNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a multivalent compound (C) comprising at least two binding moieties having specificity for different binding sites on the same target. (C) is useful for treating euplastic tumour growth and disease associated with angiogenesis or hyperproliferation (claimed). (C) is useful for treating diseases such as arthritis, atherosclerotic is useful for treating diseases such as arthritis, atherosclerotic bladues, corneal graft neovascularization or ocular diseases. (C) is small and can more easily reach a target. (C) localizes more effectively to the target site than other targeting compounds due to its binding to more than one site on the same target. This sequence represents a DNA more than one site on the same target.
                                                                                                                                                                                                                                Multivalent compounds with at least two binding moities having specificity for different binding sites on the same target, useful for treating and diagnosing, e.g. angiogenic and hyperproliferative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

The present invention relates to a method for analysing a target nucleic acid consisting of repetitive and non-repetitive sequences. The method comprises hybridising a polynucleotide probe comprising a segment complementary to a non-repetitive region and a segment complementary to an on-repetitive region and a segment complementary of an adjacent repetitive region, where the second segment consists of a defined number of repeats, and determining the melting point temperature of the hybrid. The method is used to analyse microsatellites, especially microsatellite instability, particularly as a means for detecting meredicaty tumours. Alternatively, the method is used to identify an individual in a population. The present sequence is a probe for Mononucleotide repeat locus BAT25, and was used to illustrate the
Analyzing repeat sequences in DNA using a probe which hybridizes to adjacent repetitive and non-repetitive regions and determining hybrid melting point is useful to detect microsatellite instability such as in hereditary cancer.

The invention describes a method of typing (M1) a gene (I) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (I) that includes PML, using as template a DNA sample containing at least one segment of (I); and Typing genes that contain polymorphic microsatellite loci, useful for identifying predisposition to disease, by amplification and determining length of amplicons. Example 3; Page 28; 64pp; German. 09-AUG-2002; 2002DE-01036711. ģ (UYHO-) UNIV HOHENHEIM. Geldermann H, Preuss WPI; 2004-215730/21.

Transgenic metabolic metabo determining the length of the resulting amplicon(s). Also described are: a method of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or more PML; and predisposition (M3) of diseases associated with gene that include bML. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to diseases and for prediagnosis of such diseases, aspecially prion to but also cystic fibrosis, malignant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins, hormones or transcription factors. The method is sinpler, quicker and particularly less expensive than known methods based on sequencing. This sequence represents a primer used to genotype a region of the cow prion protein (PrP) comprising a polymorphic microsatellite locus. Gaps Novel mammalian G protein coupled receptors, useful for identifying compounds that modulates diagnosing and treating disease condition associated with GPCR dysfunction e.g. autoimmune diseases, angina pectoris, Parkinson's disease. ö 0.9%; Score 24.8; DB 1; Length 28; 92.9%; Pred. The invention relates to human and mouse G protein-coupled receptors

(GPCRS) and nucleic acids encoding them. The invention also relates to

sequences at least 90% identical to the GPCR proteins and nucleic acids

of the invention; methods of treating, preventing or diagnosing diseases

consounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR-related diseases; a transgenic

compounds useful in the treatment of GPCR per invention; and wite coupling decreases

compounds and different GPCR polynucleotides of the invention. The

compounds useful in the discloses variants of the GPCR polypeptides and vectors

comprising a GPCR nucleic acid. The GPCR nucleic acids and proteins may

be used in the diagnosis, treatment or prevention of a wide variety of

diseases including neurological disorders (e.g., Alzheimer's disease,

depression, diabetic neuropathy, Parkinson's disease or schizophrenia);

compounds and disorders of the colon or intestine

compounds and disorders of the colon or intestine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Syndrome); cardiovascular disorders (e.g., angina, cardiac arrhythmia or myocardial infarction); muscular disorders (e.g., angina, cardiac arrhythmia or myocardial infarction); muscular disorders (e.g., autoimmune disorders (e.g., antoimmune disorders (e.g., antoimmune disorders (e.g., antoimmune disorders or AIDS); bone and joint disorders (e.g., osteoarthritis, rheumatoid arrhitis, gout or osteoporosis); metabolic or nutritive disorders (e.g., obesity, enzyme deficiency-related diseases or vitamin deficiency-related diseases); and disorders of the kidney, liver, lung, breast, ovary, uterus, prostate, testis, skin, stomach, pancreas, spleen, thymus and thyroid (e.g., cancers). The present sequence represents a RACE (rapid mylification of cDNA ends) PCR primer used in the isolation of cDNA encoding human GPCRs. Note: The full sequence data for this patent did not form part of the printed specification; those sequences not shown the contained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              inhibitor; hyperproliferative disease; ss;

                                                                                                                                                                The oligonucleotides AAT99279-T99286 were used as competitor digonucleotides for the binding of PUR pritein to DNA. The PUR sequence can be used to identify chemical or biological compounds that bind to PUR or binding fragments of PUR. Inhibitors of PUR activity may be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This is the nucleotide sequence of an oligonucleotide used as a competitor with the PUR element in the method of the invention, involving the use of the PUR protein and its fragments, which inhibit PUR protein binding to PUR element or other proteins. Inhibitors of PUR activity may be useful for treating viral infections and hyperproliferative diseases
                                                                                         Assays for PUR protein ligands or modulators - using immobilised PUR protein or fragments, to treat hyper-proliferative diseases, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               protein and its fragments - that inhibit PUR protein binding to PUR
                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
          ö
                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a monoclonal antibody that specifically binds to an epitope of the PUR protein. Antibodies that bind to the PUR protein and neutralise PUR activity may be used to treat hyperproliferative diseases such as cancer. PUR antibodies may be used diagnostically to detect aberrant expression of the PUR protein and/or matations in the PUR gene. The present sequence represents an oligonuclectide used in the cloning and sequencing of the PUR protein and its sequence element PUR repeat, in an example from the present invention

This invention describes a novel method (M1) for inserting a nucleic acid (N1) into a circular vector (V1) comprising joining ends of N1 and V1 under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or DNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as easily cloned, allowing highly representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA4031-A40366 represents primers used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inserting a nucleic acid into a circular vector comprising joining their ends, melting, and reannealing ends at two different concentrations, useful for cloning small amounts of nucleic acids and forming genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match 0.9%; Score 24; DB 1; Length 24; Best Local Similarity 100.0%; Pred.                                                                                                                                                                                                                 This invention describes a novel method (MI) for inserting a nucleic acid (NI) into a circular vector (VI) comprising joining ends of NI and VI under a first nucleic acid concentration, melting hybridized cohesive circularization ends, and reannealing the ends at a second concentration. The methods are useful for the cloning small amounts of nucleic acids and forming genomic libraries of complex populations of DNA or CNNA. The methods allow the cloning of minute amounts of nucleic acids efficiently and avoids the size selection problems of prior art systems. Larger nucleic acid fragments are just as asaily cloned, allowing highly representative libraries to be made. Vector to vector ligation is avoided using the methods. AAA40351-A40366 represents primers used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vaccine, cytostatic, virucidal; bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                   Inserting a nucleic acid into a circular vector comprising joining their

                                                              response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immuno response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects adainst tumour antigens, viral antigens (e.g. herpesviridae, retroviridae, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour, viral infection, bacterial infection; fungal infection, parasitic infection, cancer, asthma, infectious disease, allergy, immune deficiency, phosphorothioate; ss.
                                                                                                                                                                                                                                                    immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpseviriade, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. horspesviriade, retroviridae) haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, astham, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                 against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Bacherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or fimmune deficiency. The present sequence an also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the present sequence may have a phosphorothioate backbone

(I) is useful for: (a) assessing whether a patient is afflicted with prostate cancer. (b) monitoring the progression of prostate cancer in a patient; (c) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cancer has metastasized in a patient; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a patient; (i) is also useful as a pharmacodyanamic or pharmacogenomic marker
                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumacoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic acid of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                        Angiogenesis inhibitor; se; angiogenesis; solid tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; heemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis; scleroderma; hypertrophic scar.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to inhibiting angiogenesis in a subject,

```
The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeosis, obler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, intestinal adhesions, atherosclerosis, scleroderma and wound granulation, intestinal adhesions, atherosclerosis, scleroderma and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to inhibiting angiogenesis in a subject, comprising administering at least one antiangiogenic nucleic acid molecule. Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, macvascular glaucoma, retrolental fibroplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   rubeosis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, wound granulation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.

The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigons and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, concer, leukaemia, liver cancer, elegencer, Hodgkin's lymphoma, non-CC cancer, pancreatic cancer, myeloma, oral cavity cancer, ovarian CC cancer, pancreatic cancer, prostate cancer, indexoma, skin cancer, stomach cancer, testicular cancer, and uterine cancer. The CC cancer, stomach cancer testicular cancer, and uterine cancer. The concernation of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Component detection; clinical diagnosis; cell detection; drug detection; metabolite detection; pesticide detection; ligand detection; ss.
                                                                                                                                                                                                                                                                                       Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

This invention represents a method for detecting the presence of a polymucleotide sequence, differences in polymucleotide sequences or mutations in genomic DNA. The method involves contacting 3 coligonucleotide probes with a sample contacting a polymucleotide. The clirat probe hybridises to a region of the polymucleotide. The second and third probes can bind a second region of the polymucleotide contacting a second and third probes are identical except for the sequence. The second and third probes are identical except for the sequence or difference of one or more nucleotides. The reaction medium is presence or difference of one or more nucleotides. The reaction medium is contacted to conditions for forming substantially non-dissociative termolecular complexes, which can be at least one of, the polymucleotide sequence with the first and third probes. The oligonucleotide probes have labels on covalently bound to allow for their detection upon binding. The method of the invention is useful for detecting the presence of a single concovalent properties of a single concovalent properties (SNP) in a fragment of genomic DNA. The method can be used for the direct detection of nucleic acid in very small contacting amplification. In addition, the method may be carried contacting amplification of the target and reference sequences.
                                                                                                                                                                                                                                                                                                                             Detecting presence of polynucleotide, differences between polynucleotide sequences, useful for detecting single nucleotide polymorphism and alleles of polynucleotide sequence involves use of three competitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sequence represents an oligonuclectide probe A24 used to create dopTAR chimiluminescer sensitiser particles in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                 probes.
The invention relates to the detection of multiple components in a medium, comprising combining the medium with at least two sensitiser reagents, and at least one reactive reagent activated by a product can entire the sensitiser reagents when activated; and differentially activating the sensitiser reagents. The combination of sensitiser reagents and reactive reagent (s) allows differential detection of the components. Methods of the invention may be used for the detection of ligands, receptors and polynucleotides, and also for the detection of components, Mosphate esters, thiophosphates, carbamates and polyhalogenated sulfenamides) and pollutants. Methods of the invention allow the detection of multiple analytes in a single test medium. An application of the methods of the present invention would be in the field of clinical diagnostics. The current sequence represents A24 oligonucleotide for the creation of oligonucleotide coated phthalocyanine sensitiser particles (PC-A24)
                                                                                                                                                                                                                                                                                                                                                                                                                   Detection of multiple analytes, e.g. ligands, receptors, polynucleotides and pollutants, involves adding a combination of sensitizer reagents and reactive reagent Actuatable by a product of the sensitizer reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.9%; Score 24; DB 1; Length 24;

07-FEB-2002

```
The invention relates to generating mRNA-cDNA hybrids, comprising (a) providing a solution containing a nucleic acid template, one or more primars complementary to the sense conformation of the nucleic acid template, and with an RNA cemplate, and one or more promoter-linked primars complementary to the antiesnse conformation of the nucleic acid template, and with an RNA prime to synthesise a first cDNA strand, (c) treating the first cDNA certain with one or more promoter-linked primers to synthesise a promoter-linked double-stranded nucleic acid, (d) treating the promoter-linked double-stranded nucleic acid, (d) treating the promoter-linked couble-stranded nucleic acid, (d) treating the promoter-linked couble-stranded nucleic acid, (d) treating the promoter-linked couble-stranded nucleic acid, (e) treating the mRNA fragments with one or more primers to synthesise and (e) treating the mRNA fragments with one or more primers of pure and consult of the amplified mRNA.

CC double-stranded nucleic acid to synthesise amplified mRNA fragments and secretific mRNA-cDNA hybrids for transducing biological effects of interest in vitro as well as in vivo, for inhibiting gene function in prokaryotes and eukaryotes in vivo and in vitro, for suppressing cancer-related condidate molecular pathways with systematic knock out of involved molecules, in high throughput screening of gene functions in studying candidate molecular pathways with systematic knock out of involved molecules, in high throughput screening of gene function in the physiological conditions. The mRNA-cDNA hybrids may be used to screen for special gene functions, for manipulating gene expression in vitro, and comporation to increase the stability and effectiveness of transfected provide higher affinity of the mRNA hybrids may burdleotide analogue conditions. The mRNA comparase) enzyme may due to lower hinding interaction between NNA-NNA winderses harm RNA-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RNA due to lower binding interaction between DNA-RNA duplexes than RNA-RNA duplexes. The cDNA part of a D-RNAi provides further antisense gene knockout activity in addition to the posttranscriptional gene silencing (PTGS) mechanisms of the sense-RNA template, resulting in multiple specific gene interference effects with one probe. The present sequence is a poly(dT) PCR primer used in conjunction with oligo(dC)loN primers to reverse transcribe mRNA into first strand cDNA in the method of the
                                                                                                                                                                                                                                            Generating mRNA-cDNA hybrids for suppressing cancer-related genes, or treating or preventing microbe related genes, comprises thermocycling steps of promoter-linked double-stranded cDNA or RNA synthesis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Immunostimulatory oligonucleotide SEQ ID NO:53

(first entry)

23-MAY-2003 ABZ80181;

```
The present invention describes immunostimulatory nucleic acids of 14-100 nucleotides in length comprising the formula 5' XIDCGHX2 3' (I), where XI or X2 = independently any sequence 0-10 nucleotides, D = nucleotide other CC than C; C = cytosine; G = guanine; H = nucleotide other than G: The cimmunostimulatory nucleic acid further comprises a sequence consisting of immunostimulatory nucleic acid further comprises a sequence consisting of P and N positioned immediately 5' to X1 or 3' to X2 and N is a B cell contralising sequence, where N begins with a CGG trinucleotide and is at contralising sequence, where N begins with a CGG trinucleotide and is at cleast 10 nucleotides long. Also described: (1) a pharmaceutical composition comprising the immunostimulatory nucleic acid and a carrier; cand (2) treating an allergic condition. (I) has antiallergic activity and can be used in gene therapy. (I) can be used for preparing a composition of for treating a variety of immune related disorders such as cancer. CC infectious diseases and allergic disorders. (I) also stimulates the cativation of natural killer cells and the production of type 1 cc interferon (IFN). The present sequence represents an immunostimulatory composition composition and the present invention composition composition and carrier colligonucleotide, which is used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New immunostimulatory nucleic acid, useful for preparing a composition for treating an allergic condition.

Improved polymerase thermocycling reaction for nucleic acid amplification, by thermal cycling of promoter-linked nucleic acid replate synthesis and in vitro transcriptional amplification of nucleic

Example 7; Page 14; 28pp; English.

The invention relates to an improved polymerase thermocycling reaction (MI) for linear amplification of nucleic acid templates (I), combining the denaturing a number of nucleic acid templates (I), combining the denaturing a number of parimer (P2), a number of deoxynucleotide triphosphates and ribonucleotide triphosphates and muber of deoxynucleotide triphosphates and ribonucleotide triphosphates and muber of deoxynucleotide triphosphates and ribonucleotide triphosphates.

CC ontacting templates, denaturing the promoter-containing templates to contacting the denatured promoter-containing templates of promoter-containing templates, denatured promoter-containing templates, denatured promoter-containing double-stranded mucleic acid templates are flamated by Pi in one and and P2 in the other and of the other orientation, transcribing the promoter-containing double-stranded bub templates. Conteating the primer region of the promoter-containing double-stranded bub templates, conteating the primer region of the promoter-containing double-stranded bub templates, conteating the primer region of the primer region of the primer amplified RNA sequences with P2 to form a number of cDNA and a number of promoter-containing double-stranded by templates, conteating double-stranded by templates, conteating double-stranded by templates, conteating double-stranded by templates, conteating double-stranded bolymerase thermocycling reaction for linear amplification of mucleic acid sequences, and thus for producing mRNA expression profile of a cell by M1 to generate multiple copies of the calls in both normal and diseased state, amplifying the diseased state, by generating aberrant protein production of the protein coded for by the isolating aberrant protein production of the protein coded for by the isolating aberrant protein production of the protein coded for by the isolated mRNA. M1 is also useful for treating a percent expression of a cell in a diseased state caused by behavior deservation production of cell in a diseased state ca

```
The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                       The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                  Treating non-allergic inflammatory diseases, such as psoriasis, ecze allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ss; nucleic acid amplífication; multiple step elimination; varying reaction condition elimination; poly A tract.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatisis, latex dermatitis or inflammatory bowel disease e.g., ulcerative collitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunostimulatory; antiinflammatory; dermatological; antipsoriatic; antiulcer; gene therapy; vaccine; non-allergic inflammatory disease; psoriasis; eczema; allergic contact dermatitis; latex dermatitis; inflammatory bowel disease; ulcerative colitis; Crohn's disease; ss.

Comprises primer extension by reverse transcriptase and hybridising an oligonucleotide to the single stranded DNA, where the oligonucleotide is blocked from extension at the 3' end. The method is useful for amplification of nucleic acids. In the new method, a promoter is protected from degradation throughout the method. The promoter is constructed so that it does not serve as a primer for extension of a sequence that is complementary to the target sequence, i.e. it is blocked. The method can be combined with other processes to eliminate the need for multiple steps and varying reaction conditions and their associated problems. At least three otherwise separate enzymatic reactions can occur consecutively in one phase (i.e., without organic extraction and precipitation), more preferably in the same reaction vessel. Preferably, cDNA synthesis according to the new method may occur in a modifical low salt buffer. The present sequence represents the poly A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                          invention relates to a method of amplification of nucleic acid which
                 Amplification of nucleic acids, where the promoter is blocked from extension at the 3' end, useful for eliminating multiple step reactions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present

invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-responsive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-respondive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Butterfly biliverdin binding protein BBP-B1X oligonucleotide SEQ ID:106
                                                                                                                                                                                                                                                                                                                                                                 Treating and/or preventing allergy or asthma using an immunostimulatory nucleic acid alone or in combination with an asthma/allergy medicament.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The present invention describes a merical to the combination products between two nucleotide sequences. The method comprises combining an initial set of oligonucleotides corresponding to a distinct nucleotide sequence and the authorities and further combining the corresponding to a distinct nucleotide sequence and further combining the initial and subsequent sets of combination oligonucleotides having a sequence region corresponding to the initial nucleotide sequence and a sequence region corresponding to the second oligonucleotide sequence. Also described is a method of creating a collection of recombination products between two genes. The methods and compositions of the present invention are useful in the field of synthetic gene technology, and more specifically, to generating a collection of recombination products between distinct nucleotide sequences. They can also be used in cassembling a library, or a population or a collection of polypeptide variants that correspond to single or multiple polynucleotide recombination products. The present sequence is used in the cerombination of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                           The present invention describes a method for creating a collection of recombination products between two nucleotide sequences. Detecting nucleic acid targets, useful e.g. for diagnosing single nucleotide polymorphisms, by extension of capture probe complementary to open circle probe.

Example 1; Fig 5; 66pp; English.

The invention is directed to novel methods of amplifying and detecting CC DNA using rolling circle amplification (RCA). The invention relates to detecting a target sequence (I), which involves using a capture probe (CC DNA that is complementary to an open circle probe and includes a capture probe (CP) that is complementary to an open circle probe and includes one domain complementary to an OCP (Open circle probe) and a second domain that contains a CC cleavage site (CS), to form a device; treating CP with (I) and OCP for form a hybridisation complex (HC); treating CP with a ligase so that OCP is circularised, forming a second complex (HC); treating CP with a C cleavage agent, to cut at CS, and adding an extended CP, which is cleavage agent, to cut at CS, and adding an extension enzyme (ES) and cleavage agent, to cut at CS, and adding an extension enzyme (ES) and cleavage agent, to cut at CS, and adding an extension enzyme (ES) and cloading is used for detection, genotyping and/or quantification of the method is used for detection, genotyping and/or quantification of the esting, particularly detection of single-nucleotide polymorphisms. The method permits a high level of multiplexing, and since it provides companies that of a single base extension (SBE) probe used in SNP invention in the invention of the present of multiple of companies of the method of the invention of the province is that of a single base extension (SBE) probe used in SNP invention nvention

Stimulating antibody dependent cellular cytotoxicity, modulating immune response and inducing antigen-specific immune response in subject by administering imidazoguinoline agents in conjunction with other agents.

Disclosure; Page 11; Opp; English.

The invention relates to methods for stimulating antibody dependent cellular cytotoxicity (ADCC), for modulating immune response and for inducing antigen-specific immune response which involve administering imidazoquinoline agents in conjunction with other agents. The method is useful for stimulating ADCC in a subject having a disorder chosen from asthma/alleryy, infectious disease, cancer and warts. The present sequence is an immunostimulatory oligonucleotide used to illustrate the method of the invention

New immunostimulatory oligonucleotide comprising non-palindromic nucleic acid sequence motif, useful for inducing B-cell activation, treating, preventing or ameliorating immune system disorder or tumoral disease e.g. nelanoma

Example 3; SEQ ID NO 19; 139pp; English.

This invention relates to novel immunostimulatory oligonucleotides that contain a non-palindromic sequence motif. Specifically, it refers to DNA oligonucleotides (without a CpG motif), which can stimulate an immune response in animals of the order of primate, including humans. The immune artibody production in Brealls, as well as cell differentiation, cytokine antibody production in B-cells, as well as cell differentiation and cytokine production in plasmacycoid dendritic cells. The present invention describes immunomodulator compositions that also comprise an invention describes immunomodulator compositions that also comprise an enterpy for inducing B-cell activation, treating, preventing or therapy for inducing B-cell activation, treating, preventing or mellorating an immune system disorder or a tumoural disease including chronic myelogenous leukaemia, melanoma, Kaposi's sarcoma, and renal cell carcinoma. This oligonucleotide sequence is the non-CpG DNA oligo IMT the invention. used in an exemplification of

ö The invention relates to a method of detection of deposition unit misalignment of an in situ polymeric array synthesis device which comprises synthesising test probe feature(s) on substrate using in situ polymeric array synthesis device, contacting test probe feature with at least two different distinguishably labelled targets and evaluating binding of labelled targets to test probe feature to detect any pulse jet misalignment of polymeric array synthesis device. The method is useful for detecting deposition unit misalignment e.g. printhead misalignment, of an in situ polymeric, e.g. nucleic acid, array synthesis device. The method is easy to use, cost effective effection and/or adjustments of misalignments and may enable immediate detection and/or adjustments of one or more printheads of an in situ nucleic acid array synthesis fluid Gaps Detection of deposition unit misalignment of in situ polymeric array synthesis device, by contacting test probe feature with different distinguishably labeled targets, and evaluating binding of labeled deposition device if misalignment is detected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a method of detection of deposition unit
misalignment of an in situ polymeric array synthesis device which
comprises synthesising test probe feature(s) on substrate using in situ
polymeric array synthesis device, contacting test probe feature with at
least two different distinguishably labelled targets and evaluating
contacting of labelled targets for test probe feature to detect any pulse jet
misalignment of polymeric array synthesis device. The method is useful
for detecting deposition unit misalignment e.g. printhead misalignment,
of an in situ polymeric, e.g. nucleic acid, array synthesis device. The
method is easy to use, cost effective effective at detecting printhead
misalignments and may enable immediate detection and/or adjustments of
cone or more printheads of an in situ nucleic acid array synthesis fluid
deposition device if misalignment is detected. The present sequence
represents an oligonucleotide synthesised on a microarray.
